Getting Started with Fido Anti Spam Cloud

Jon Morby - 2017-03-02 - 0 Comments - in Fido Spam Cloud Anti Spam Solution

Log into the Spam Panel at <https://spamcloud.fido.net/> using your email address and your password.

To use the outbound SMTP scanning you need to configure your mail server as "smtp.fido.net" and authenticate using the details configured under outbound -> email users

You should also configure your SMTP client to use port 587 for SMTP Submission

This is achieved on Exchange 2007/2010 by executing the following command at the Exchange Powershell

```
Powershell> Set-SendConnector -Identity "Win*" -Port 587
```

Assuming you have the default Identity of "Windows SBS Internet Send \$hostname" alternatively replace the Win* in quotes with the identity of your SMTP Connector - which can be discovered using the "Get-SendConnector" cmdlet
